

MODEL DA2

DO-ALL SERIES II DIFFERENTIAL PRESSURE REDUCING REGULATORS

OVERVIEW

The Model DA2 is a differential reducing regulator used to maintain a constant pressure differential between a fluid loading pressure (P_{LOAD}) piped to the spring chamber and the regulator's outlet pressure (P_2). In the Model DA2 the P_2 pressure is higher than the P_{LOAD} (Positive Bias). The amount of bias or differential pressure (ΔP_{DIFF}) is controlled by the user adjustable setting of the range spring in the spring chamber.

The regulator uses a flow-to-open, cage balanced trim. The diaphragm is isolated from the fluid flow path by a balancing piston, which allows the user to specify either internal or external sensing of the P_2 pressure.

FEATURES

Versatile:	Four basic materials and multiple trim material combinations to select from.
Tight Shutoff:	Multiple composition materials provide Class IV or VI inboard leakage rates. Designed as a soft-seated valve.
Capacity:	Highest in the industry. Allows smaller body sizes than competitors in a majority of applications.
Pressure Drop:	Highest in the industry when coupled with high flow capacity.
Trim Design:	"DO-ALL" trim design provides <u>FTO</u> and <u>pressure balancing</u> for higher inlet pressure. Results in unmatched <u>sensitivity</u> and <u>stability</u> . Internals are <u>cage-contained</u> within easily removable <u>quick change trim</u> .
Rangeability:	Basic valve gives outstanding rangeability due to close tolerances, balanced trim, and a broad range of elastomeric diaphragms and soft seats. Can be as high as 1000:1.
Heavy-Duty Guiding:	Both top and bottom guided to maintain stability and increased diaphragm life.
Failure Position:	DA2 fails open on loss of P_1 or P_2 pressures.

APPLICATIONS

The "DO-ALL" design allows application of all types of clean fluids. Designed primarily for gaseous and liquid service applications where excessive cavitation is absent. Excellent for atmospheric industrial gases – GN_2 , GOX , Ar, He, H_2 , CO_2 – as well as a natural gas regulator. Used as a utilities – air, oil, water, steam – regulator. Non-corrosive chemical services – gas or liquid – are possible with broad materials range.

NOTES: 1. The body P vs. T ratings are the limiting variables for flanged end connections, unless further restricted by ASME B16.5.
2. No post-weld stress relieving performed.

OPT-31: BSPT END CONNECTIONS. British Standard Pipe threads per ISO 7/1; used as an alternate to NPT ends. 1/2" – 2" (DN15-50) sizes only.

OPT-32: EXTENDED PIPE NIPPLES. Sch. 80 extension pipe nipples available for CS and SST bodies; for body sizes 1/2" – 2" (DN15-50) only.

OPT-34: SPECIAL 14" FACE TO FACE DIMENSION FOR FLANGED END CONNECTIONS. Sizes 1/2" - 1" & 1-1/2" only. See Opt.-30 for standard face to face dimension.

OPT-41: EXTENDED TUBE END CONN. SST body material only. Body sizes 1/2"-1" (DN15-25), 1-1/2" & 2" (DN40-50) only. SST extension tubes are welded to body, ending in tube diameters with 0.065 inch (1.65 mm) wall thickness. **NOT FOR HIGH PURITY REQUIREMENTS.**

OPT-55: SPECIAL CLEANING - GOX. BRZ or SST body materials only. Cleaning, assembly and packaging per Cashco Spec #S-1134, making unit suitable for Oxygen Service. **NOTE: Design Pressure Rating shall not exceed 375 psig (25.8 Barg) when body/topworks material is SST and process medium is oxygen.**

OPT-56: SPECIAL CLEANING. Cleaning per Cashco Spec. #S-1542 for all body & spring chamber materials. Higher cleaning level than standard commercial cleaning. NOT suitable for Oxygen Service.

OPT-57: SPECIAL CLEANING - Cl₂. CS or SST materials only. Cleaning per Cashco Spec. #S-1589. For chlorine gas/liquid service.

OPT-65: FLOW-THRU SPRING CHAMBER. Spring chamber provided with two female NPT connections on spring chamber, allowing loading pressurizing fluid to be recirculated. Opt-65B, C and D are recommended for heavy oils with high paraffin content; CS spring chamber only. Tapped connection sizes dependent on body size.

OPT-81: FULL DIAPHRAGM SUPPORT CONSTRUCTION. Incorporates top and bottom diaphragm support that allows reaching higher fluid pressures on the underside and topside of diaphragm. Sizes 1/2"-2" (DN15-50) only. See Table 5.

OPT-85: PRESSURE TAPS. Provides second set of inlet and outlet 1/4" (DN8) - FNPT taps with plugs (same basic material as body) on backside of body. Includes second external sensing port tap. See page 22 for details on tap location for both STD. and Opt -85.

NOTE 1: Whenever body and topworks materials are mixed, the P vs. T ratings that should be applied are those which are lowest of the two materials.

Example: CS body, DI topworks; NPT end connections, 200°F temperature.

Because the topworks is not “end flanged”, use the DI limits of “400 PSIG CWP 370/200F” from above to compare to CS limits from DAG-1C values. The DI limits are lower, so ratings from DAG-1A MUST be used as the limits.

NOTE 2: Unless stated otherwise, design pressure is Maximum Allowable Working Pressure (MAWP) for Inlet and Outlet.

		177°	20.4	11.3	24.0
		204°	17.8	10.3	21.4

NOTE 1: Whenever body and topworks materials are mixed, the P vs. T ratings that should be applied are those which are lowest of the two materials.

Example: BRZ body, DI topworks; NPT end connections, ambient temperature.
Because the topworks is not “end flanged”, use the DI limits of “400 PSIG CWP 370/200F” from DAG-1A to compare to above DAG-1B values. The DI limits are lower, so ratings from DAG-1A MUST be used as the limits.

NOTE 2: Unless stated otherwise, design pressure is Maximum Allowable Working Pressure (MAWP) for Inlet and Outlet.

† For Pressure Reducing Regulator DA2 use 700 psig (48.2 Barg) inlet / 500 psig (34.4 Barg) outlet at 150°F as maximum limits.

* See Minimum Temperature Ratings Table below.

General Statement: Statements located within this technical bulletin concerning suitability of fluids with TFE materials are general statements, and should not be construed as recommendations. Any statements of suitability are the result of a compilation of various sources of information based on experience, tests, and published technical literature. No guarantee or warranty is in anyway implied for a given particular service or application.

Additional Reference: For an inclusive listing covering a broader range of service application fluids, reference "Handbook of Corrosion Resistant Piping", P.A. Schweitzer, Industrial Press or "Compass Corrosion Guide", 2nd Edition, K.M. Pruett, Compass Publications. This publication will include information based on the following fluid variables:

1. Solution concentration
2. Pressure
3. Temperature

DAG-15

Inverse Sympathetic Ratio (ISR) - effect on regulator performance.

DA2 regulators utilize a top and bottom guide, "flow to open" trim design. The top guide also acts as a "balancing" piston to oppose the forces generated by the inlet pressure acting on the valve plug. A small residual imbalance between the piston and the valve plug helps to reduce seat leakage at high differential pressures across the seat joint. This same imbalance produces an Inverse Sympathetic Ratio, ISR effect, as the delta pressure across the seat (DP) changes. The magnitude of the ISR effect is given in Table DAG-15 for both the pressure reducing and back pressure designs.

TABLE DAG-15		
Body Size		PRV - DA1/DA2/DA4/DAP
in	(DN)	
1/2", 3/4", 1"	(15,20,25)	0.03
1-1/4", 1-1/2"	(32,40)	0.04
2"	(50)	0.02
3", 4"	(80, 100)	0.054

A typical example of the ISR effect is the rise in outlet setpoint as the inlet pressure decays from a pressure vessel or compressed gas bottle. A 1" DA1 connected to a nitrogen bottle at 3000 psig can be adjusted to deliver downstream pressure, P2, of 100 psig. The P2 will rise to 181.48 psig as the compressed gas bottle pressure decays to 284 psig, because of the ISR effect. The calculation follows below:

$$P_{sp} = P_2 + (ISR \times \Delta P_1)$$

$$\Delta P_1 = \text{INITIAL INLET} - \text{FINAL INLET}. (3000 - 284) = 2716$$

$$P_2 = 100$$

$$ISR = 0.03 \text{ (1.0" DA1)}$$

$$P_{sp} = 100 + (0.03 \times 2716)$$

$$P_{sp} = 181.48$$

NOTE: For a rising DP across the seat, the ISR effect would cause a downward shift or offset in the setpoint.

If the ISR effect is unacceptable, then two regulators installed in series will greatly reduce the overall ISR effect. Overall ISR effect = ISR (first stage regulator) x ISR (second stage regulator). For example, in the same application of a N2 bottle source using two 1" DA1 regulators, the setpoint offset - $0.03 \times 0.03 \times 2716 = 2.44$. In summary, the outlet pressure will rise from 100 psig to 102.44 psig as the inlet pressure decays from 3000 psig to 200 psig.

In a similar manner the ISR effect will produce an offset between the loading pressure, PL, and the pressure setpoint of a dome loaded regulator. For example, a 4" DA4 with an inlet pressure, P1 of 300 psig and an outlet pressure, P2 of 50 psig would require a loading pressure, $PL = (P_1 - P_2) \times ISR + P_2 = (300 - 50) \times 0.054 + 50 = 63.5$ psig. In addition, if the DP changes, then a setpoint offset would be observed with a constant loading pressure.
